# Class8: Breast Cancer Mini Project

Cynthia Perez (A16393492)

### **About**

In today's lab we will use techniques covered in class to perform a PCA on fine needle aspiration (FNA) of breast cancer mass from the University of Wisoncin

### **Data Import**

```
wisc.df <- read.csv("WisconsinCancer.csv", row.names=1)
head(wisc.df)</pre>
```

|          | diagnosis rad | ius_mean | texture_mean   | perimeter_mea | n area_mea | n            |

 ${\bf Q1}.$  How many patients/individuals/samples are in this dataset

Use nrow()

nrow(wisc.df)

```
[1] 569
     Q2. How many of the observations have a malignant diagnosis?
Use either table() or sum() functions
  table(wisc.df$diagnosis)
 В
      Μ
357 212
  sum(wisc.df$diagnosis =="M")
[1] 212
     Q3. How many variables/features in the data are suffixed with _mean?
Use grep() function
  ncol(wisc.df)
[1] 31
  colnames(wisc.df)
 [1] "diagnosis"
                                 "radius_mean"
 [3] "texture_mean"
                                 "perimeter_mean"
 [5] "area_mean"
                                 "smoothness_mean"
 [7] "compactness_mean"
                                 "concavity_mean"
 [9] "concave.points_mean"
                                 "symmetry_mean"
[11] "fractal_dimension_mean"
                                 "radius_se"
[13] "texture_se"
                                 "perimeter_se"
[15] "area_se"
                                 "smoothness se"
                                 "concavity_se"
[17] "compactness_se"
[19] "concave.points_se"
                                 "symmetry_se"
[21] "fractal_dimension_se"
                                 "radius_worst"
[23] "texture_worst"
                                 "perimeter_worst"

                                 "symmetry_worst"
```

[31] "fractal\_dimension\_worst"

```
inds <- grep("_mean", colnames(wisc.df))
length(inds)</pre>
```

[1] 10

## **Initial Analysis**

Remove "diagnosis" column before clustering the data.

```
wisc.data <- wisc.df[,-1]
```

Create diagnosis vector for later use

```
diagnosis <- as.factor(wisc.df$diagnosis)
head(diagnosis)</pre>
```

```
[1] M M M M M M M Levels: B M
```

# Clustering

We can try kmeans() clustering first

```
km <- kmeans(wisc.data, centers=2)

#use membership vector to determine what cluster each input is in
table(km$cluster)</pre>
```

```
1 2
438 131
```

Cross-table

```
table(km$cluster, diagnosis)
```

```
diagnosis
B M
1 356 82
2 1 130
```

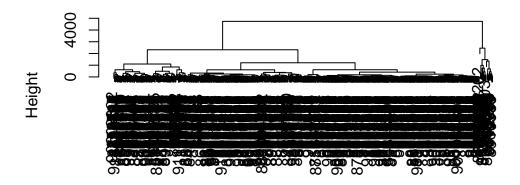

Let's try hclust(). The key input required for this function is a distance matrix as produced by the dist() function

```
hc <- hclust(dist(wisc.data))</pre>
```

We can make a dendrogram with hc vector

```
plot(hc)
```

# **Cluster Dendrogram**

dist(wisc.data) hclust (\*, "complete")

### **PCA**

Check sd of the data

```
# Check column means and standard deviations
round(apply(wisc.data,2,sd))
```

```
texture_mean
           radius_mean
                                                            perimeter_mean
                                                                         24

```

Generate our main PCA plot (score plot, PC1 v PC2 plot)

```
library(ggplot2)

res <- as.data.frame(wisc.pr$x)

ggplot(res) +
   aes(PC1, PC2, col=diagnosis) +
   geom_point()</pre>
```

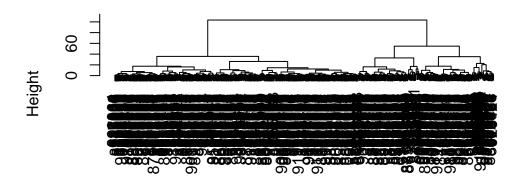

# **Combining methods**

Clustering on PCA results

```
d <- dist(wisc.pr$x[,1:3])
hc <- hclust(d, method = "ward.D2")
plot(hc)</pre>
```

# **Cluster Dendrogram**

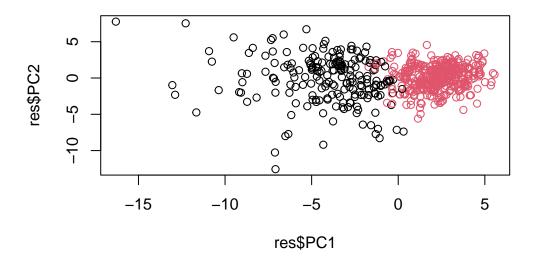

d hclust (\*, "ward.D2")

To get my clustering result/membership vector I need to "cut" the tree with cutree() function.

Color plot by groups

```
plot(res$PC1, res$PC2, col=grps)
```

#### Prediction

We can use our PCA result (model) to do predictions, that is take new unseen data and project it onto our new PC variables.

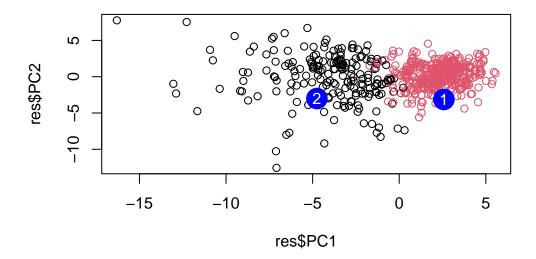

```
url <- "https://tinyurl.com/new-samples-CSV"
new <- read.csv(url)
npc <- predict(wisc.pr, newdata=new)
npc</pre>
```

```

```

#### Make plot

```
plot(res$PC1, res$PC2, col=grps)
points(npc[,1], npc[,2], col="blue", pch=16, cex=3)
text(npc[,1], npc[,2], labels=c(1,2), col="white")
```

# **Summary**

Principal Component Analysis is a super useful method for analyzing large datasets. It works by finding new variables (PCs) that capture the most variance from the original variables in your dataset.
